Operating Systems II

Prof. Sibin Mohan

Spring 2022 | Lec4.1: Multiprogramming
and Virtual Memory

Adapted from content originally created by: Prof. Yeongjin Jang

Multiprogramming Challenges

Uniprogramming Environment

- Run one program
- It can use memory space freely

Uniprogramming Environment

- Run one program
- It can use memory space freely

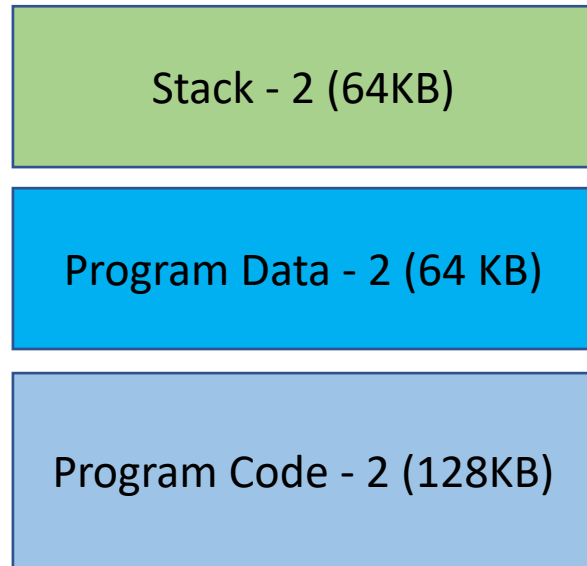

Uniprogramming Environment

- Run one program
- It can use memory space freely

Free (64 KB) 0x90000 ~ 0xa0000 (576KB ~ 640KB)
Stack - 1 (64KB) 0x80000 ~ 0x90000 (512KB ~ 576KB)
Free (192 KB) 0x50000 ~ 0x80000 (320KB ~ 512KB)
Program Data - 1 (64 KB) 0x40000 ~ 0x50000 (256KB ~ 320KB)
Free (64 KB) 0x30000 ~ 0x40000 (192KB ~ 256KB)
Program Code - 1 (128KB) 0x10000 ~ 0x30000 (64KB ~ 192KB)
OS 0x00000 ~ 0x10000 (0 ~ 64KB)

Multi-programming Environment

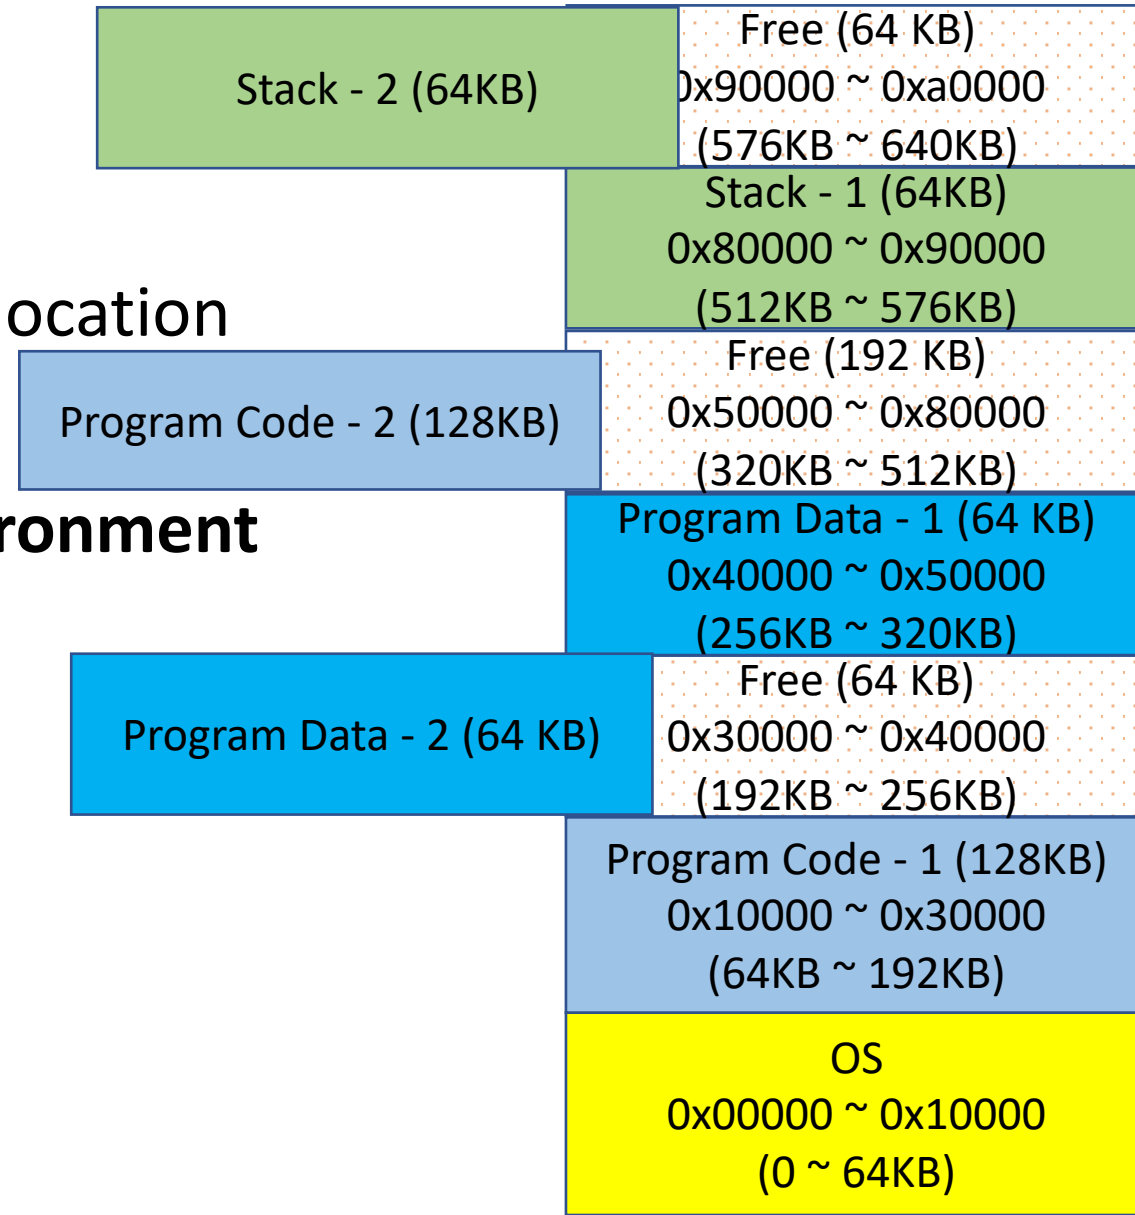

- Running **two** programs

Multi-programming Environment

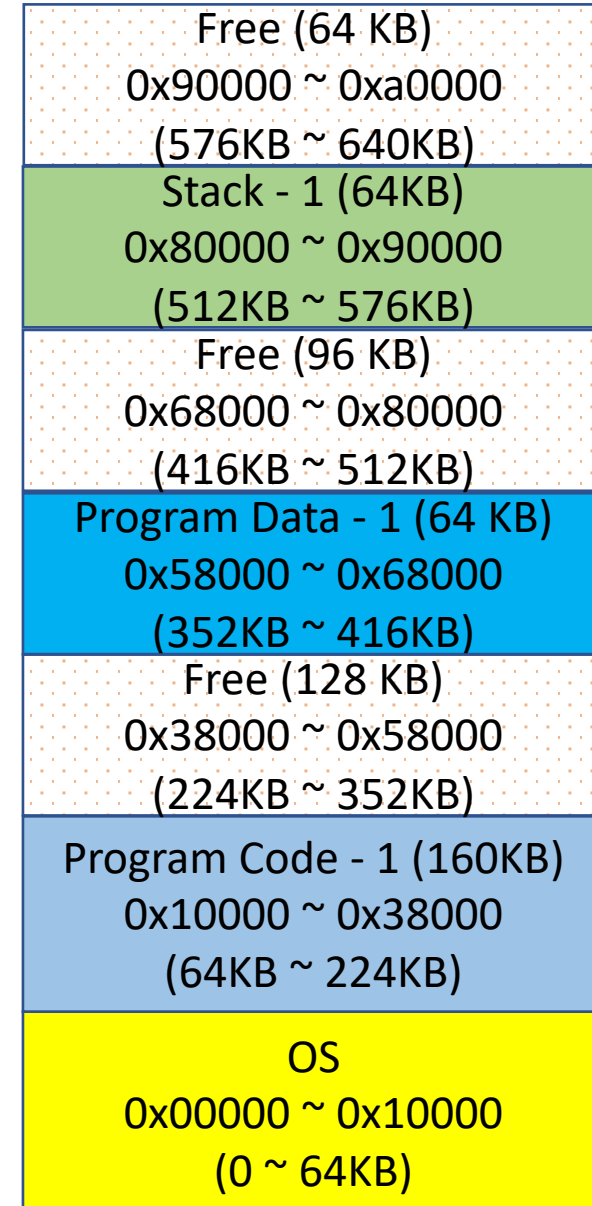

- Running **two** programs
- System's memory usage determines allocation
- Program need to be **aware of the environment**
 - Where does system load my code?
 - You can't determine, system does

No Transparency!

Multi-programming Environment

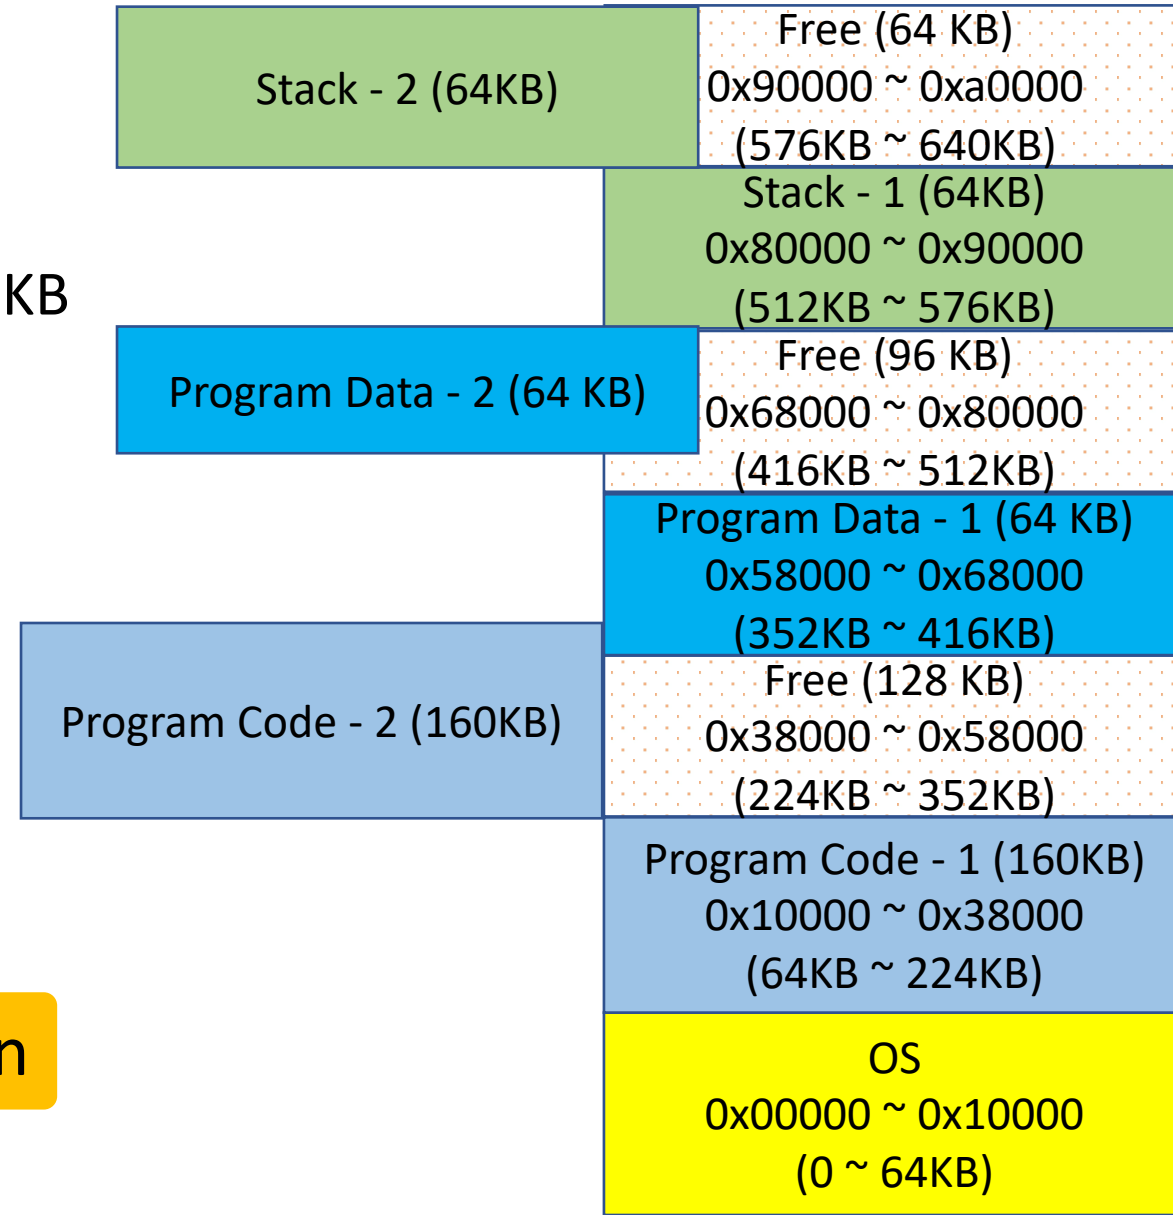

- Running **two** programs

Multi-programming Environment

- Running **two** programs
 - Program size: 64KB + 64KB + 160K = 288KB
- Free memory
 - $64 + 96 + 128 = 288\text{KB}$
- **Cannot run second Program**
 - Doesn't fit in memory

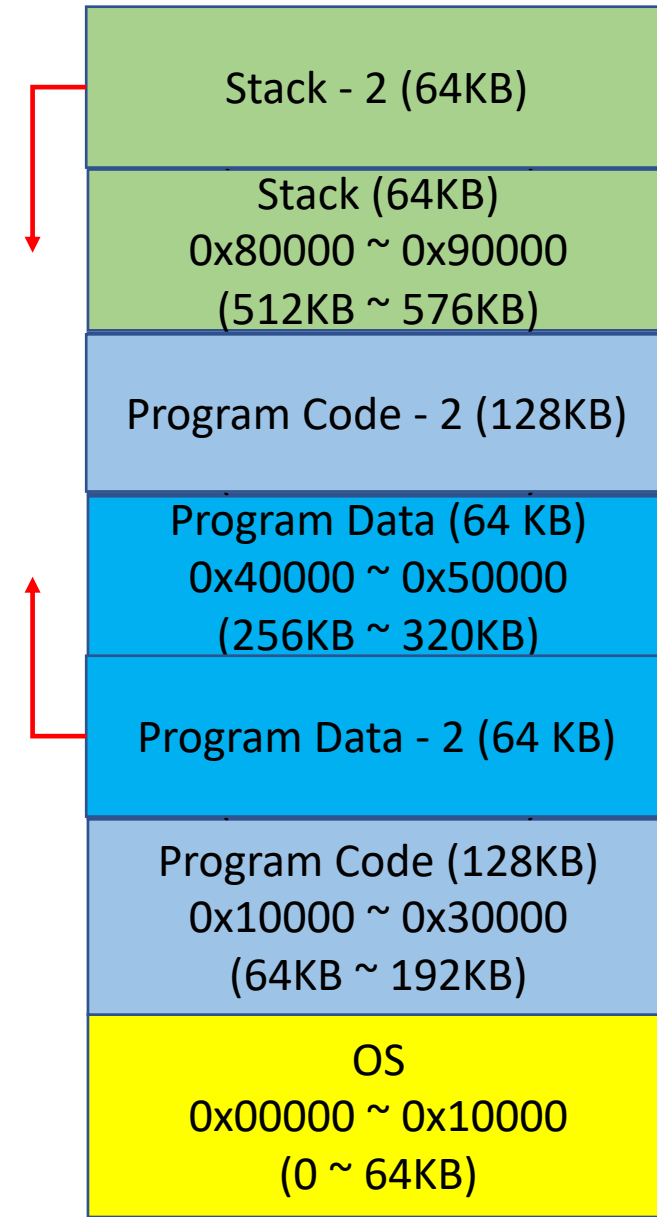

Not efficient → Memory fragmentation

Multi-programming Environment

- Running **two** programs
- What if Program-2's stack underflows?
- What if Program-2's data overflows?
- Programs can affect each other's execution

No isolation → Can lead to security problems

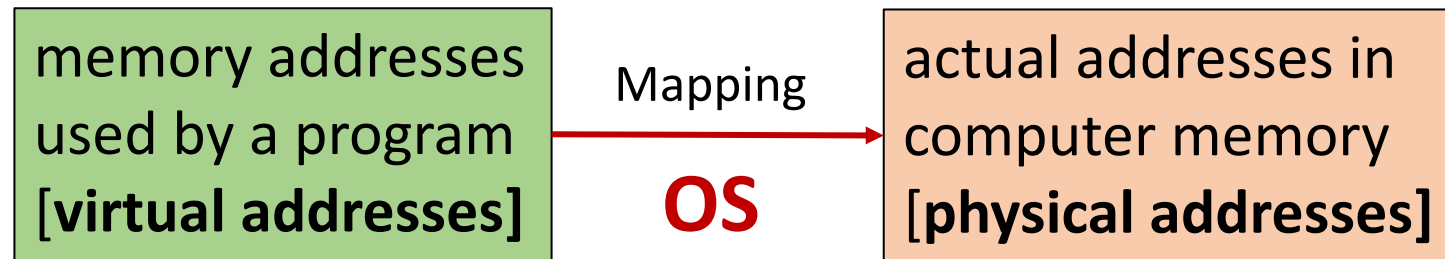

Virtual Memory to the Rescue!

So, what exactly is Virtual Memory?

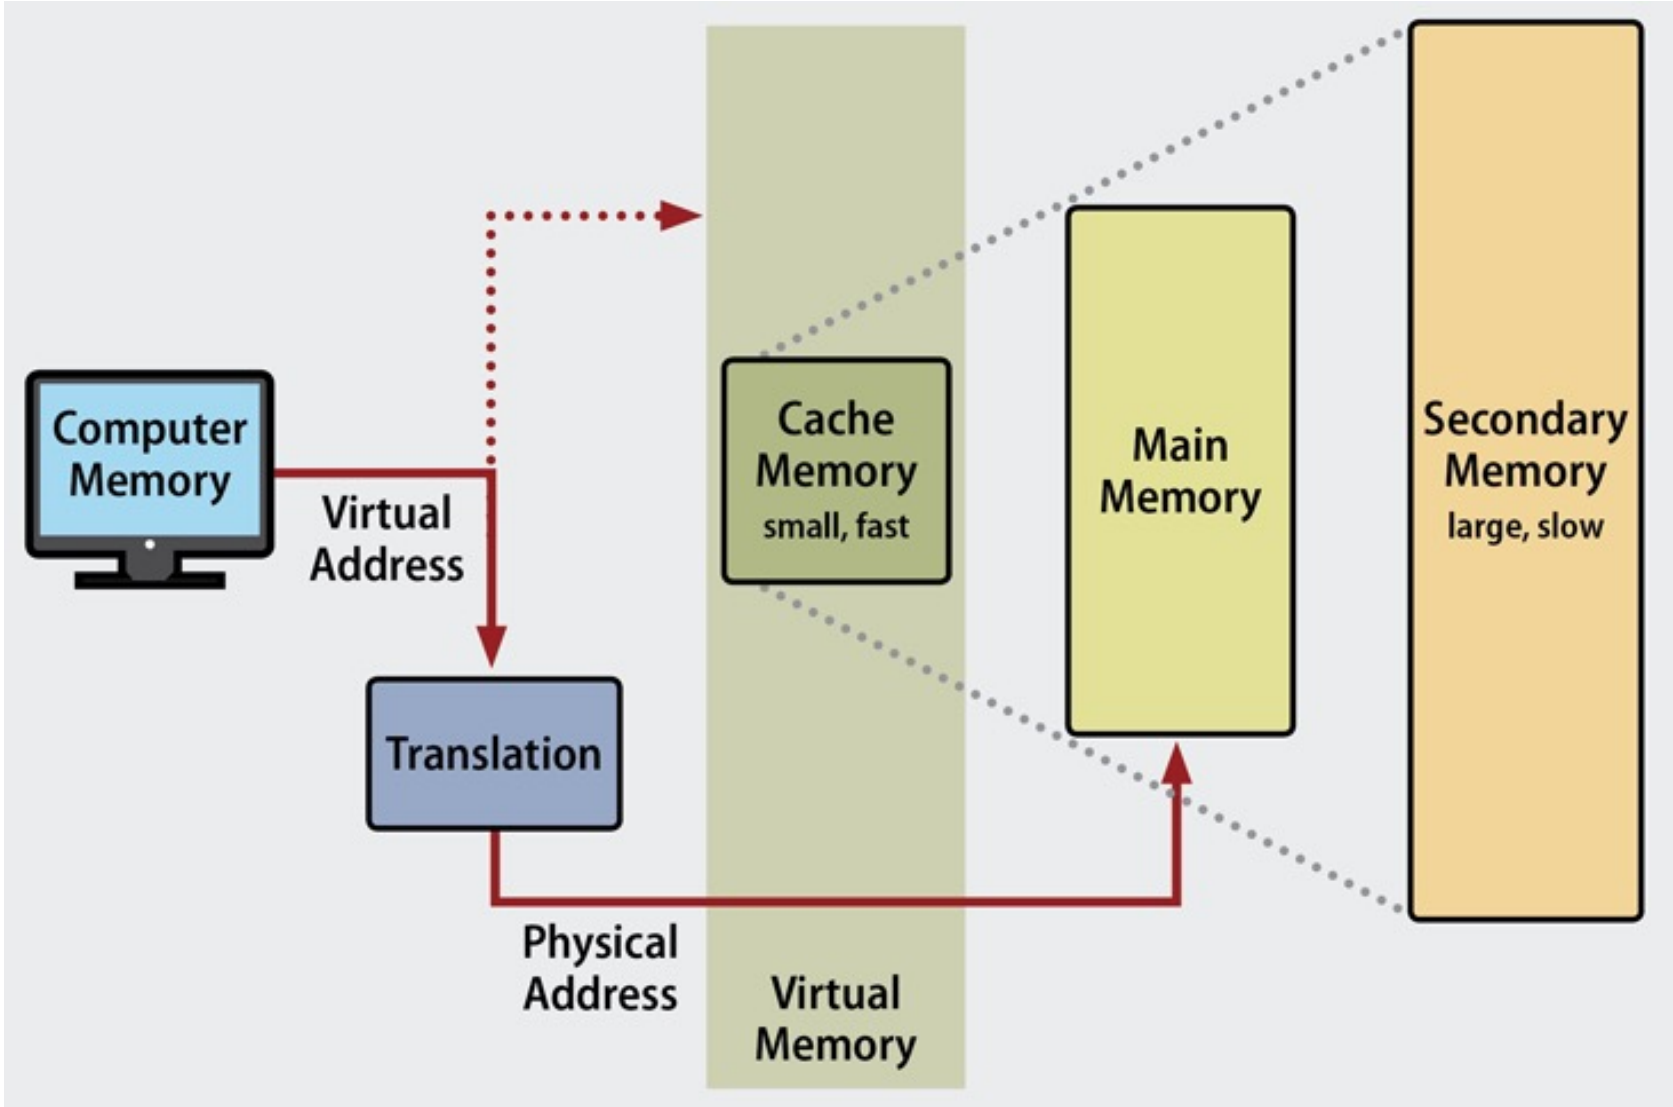

- Memory management technique
- “idealized abstraction” of storage resources actually available
 - Creates and **illusion** of a very large main memory
- **Programs can use more memory than is physically available!**

- Main storage → **appears as contiguous address space**
- **Memory management unit [MMU]** → address translation hardware in CPU

Zoomed Out View of Virtual Memory

Virtual Memory

Three Goals!

TRANSPARENCY

EFFICIENCY

PROTECTION

Three Goals | Details

- **Transparency:** programs shouldn't need to know system's **internal state**
 - Program A is loaded at **0x8048000**. Can Program B be loaded at **0x8048000**?
- **Efficiency:** do not waste memory; avoid **memory fragmentation**
 - Can Program B (288KB) be loaded if 288 KB of memory is free, regardless of its allocation?
- **Protection: isolate** program's execution environment
 - Can we prevent an overflow from Program A from overwriting Program B's data?

Paging

**A method to
implement
virtual memory**

**Split memory into multiple
blocks [E.g. 4096 bytes, 12-bi])**

Last 3 digits of page address are ZERO [hex]

E.g., 0x0, 0x1000, 0x2000, ..., 0x8048000,
0x804a000, ..., 0x7fffe000, etc.

**An indirect map between virtual
page and physical page**

Set arbitrary virtual address for a page

e.g., 0x81815000

Set physical address to that page as a map

e.g., 0x32000

0x81815000 ~ 0x81815fff → 0x32000 ~ 0x32fff

Virtual Memory | Paging

- Uses an **indirect table** that maps **virt-addr** → **phys-addr**

Virtual	Physical
0x8048000	0x10000
0x8049000	0x11000
0x804a000	0x14000
0xbffdf000	0x12000
...	...

Physical Memory

Paging: Virtual Memory

- Uses an **indirect table** that maps **virt-addr** → **phys-addr**

Physical Memory

Virtual	Physical
0x8048000	0x10000
0x8049000	0x11000
0x804a000	0x14000
0xbffdf000	0x12000
...	...

Virtual-2	Physical-2
0x8048000	0x13000
0x8049000	0x15000
0x804a000	0x16000
0xbffdf000	0x17000
...	...

Paging: Virtual Memory

Transparency: does not need to know system's internal state
 Program A & B loaded at **0x8048000**?

Physical Memory

Stack-2 0xbffdf000
Program code-2 0x804a000
Program code-2 0x8049000
Program code-2 0x8048000

Stack 0xbffdf000
Program code 0x804a000
Program code 0x8049000
Program code 0x8048000

Virtual	Physical
0x8048000	0x10000
0x8049000	0x11000
0x804a000	0x14000
0xbffdf000	0x12000
...	...

Virtual-2	Physical-2
0x8048000	0x13000
0x8049000	0x15000
0x804a000	0x16000
0xbffdf000	0x17000
...	...

Stack-2 0x17000
Program code-2 0x16000
Program code-2 0x15000
Program code 0x14000
Program code-2 0x13000
Stack 0x12000
Program code 0x11000
Program code 0x10000

Efficiency: do not waste memory

Can Program B (288KB) be loaded if only 288 KB of memory is free, regardless of its allocation?

- Uses an **indirect table** that maps **virt-addr** → **phys-addr**

Physical Memory

Stack-2 0xbffdf000
Program code-2 0x804a000
Program code-2 0x8049000
Program code-2 0x8048000

Stack 0xbffdf000
Program code 0x804a000
Program code 0x8049000
Program code 0x8048000

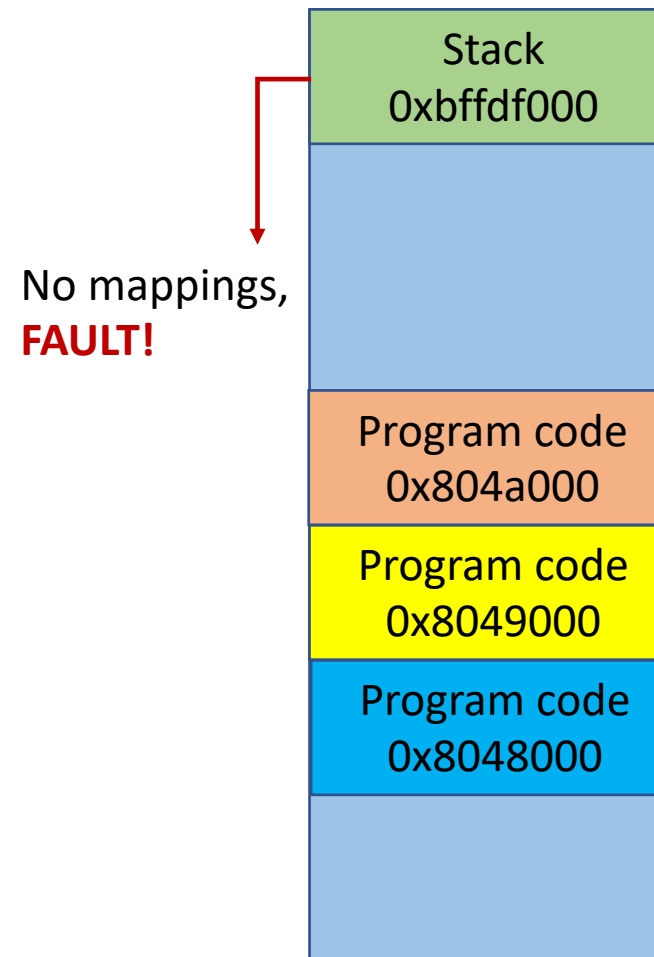

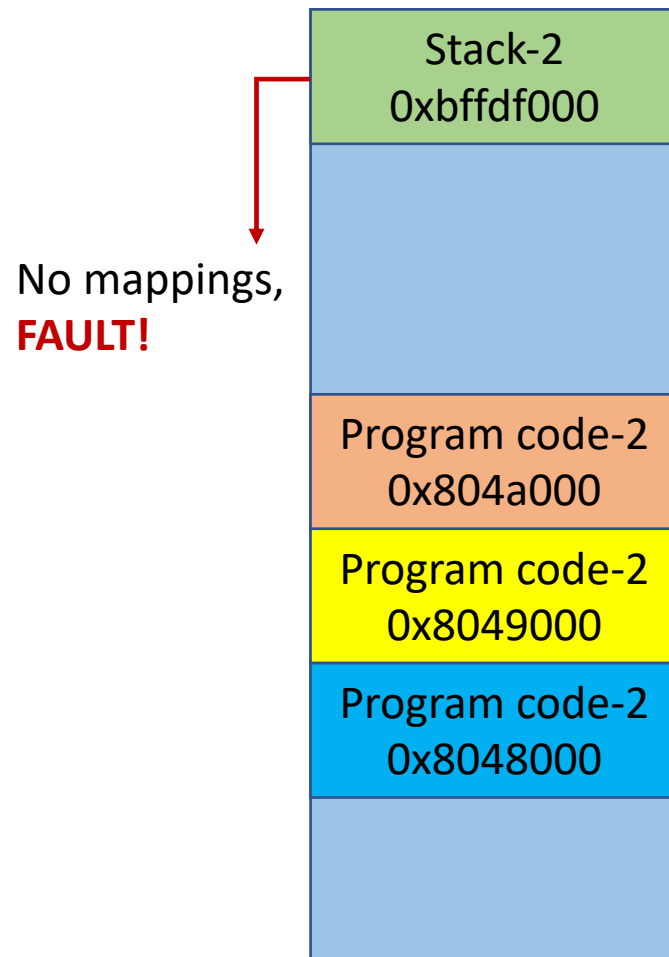

Virtual	Physical
0x8048000	0x10000
0x8049000	0x11000
0x804a000	0x14000
0xbffdf000	0x12000
...	...

Virtual-2	Physical-2
0x8048000	0x13000
0x8049000	0x15000
0x804a000	0x16000
0xbffdf000	0x17000
...	...

Stack-2 0x17000
Program code-2 0x16000
Program code-2 0x15000
Program code 0x14000
Program code-2 0x13000
Stack 0x12000
Program code 0x11000
Program code 0x10000

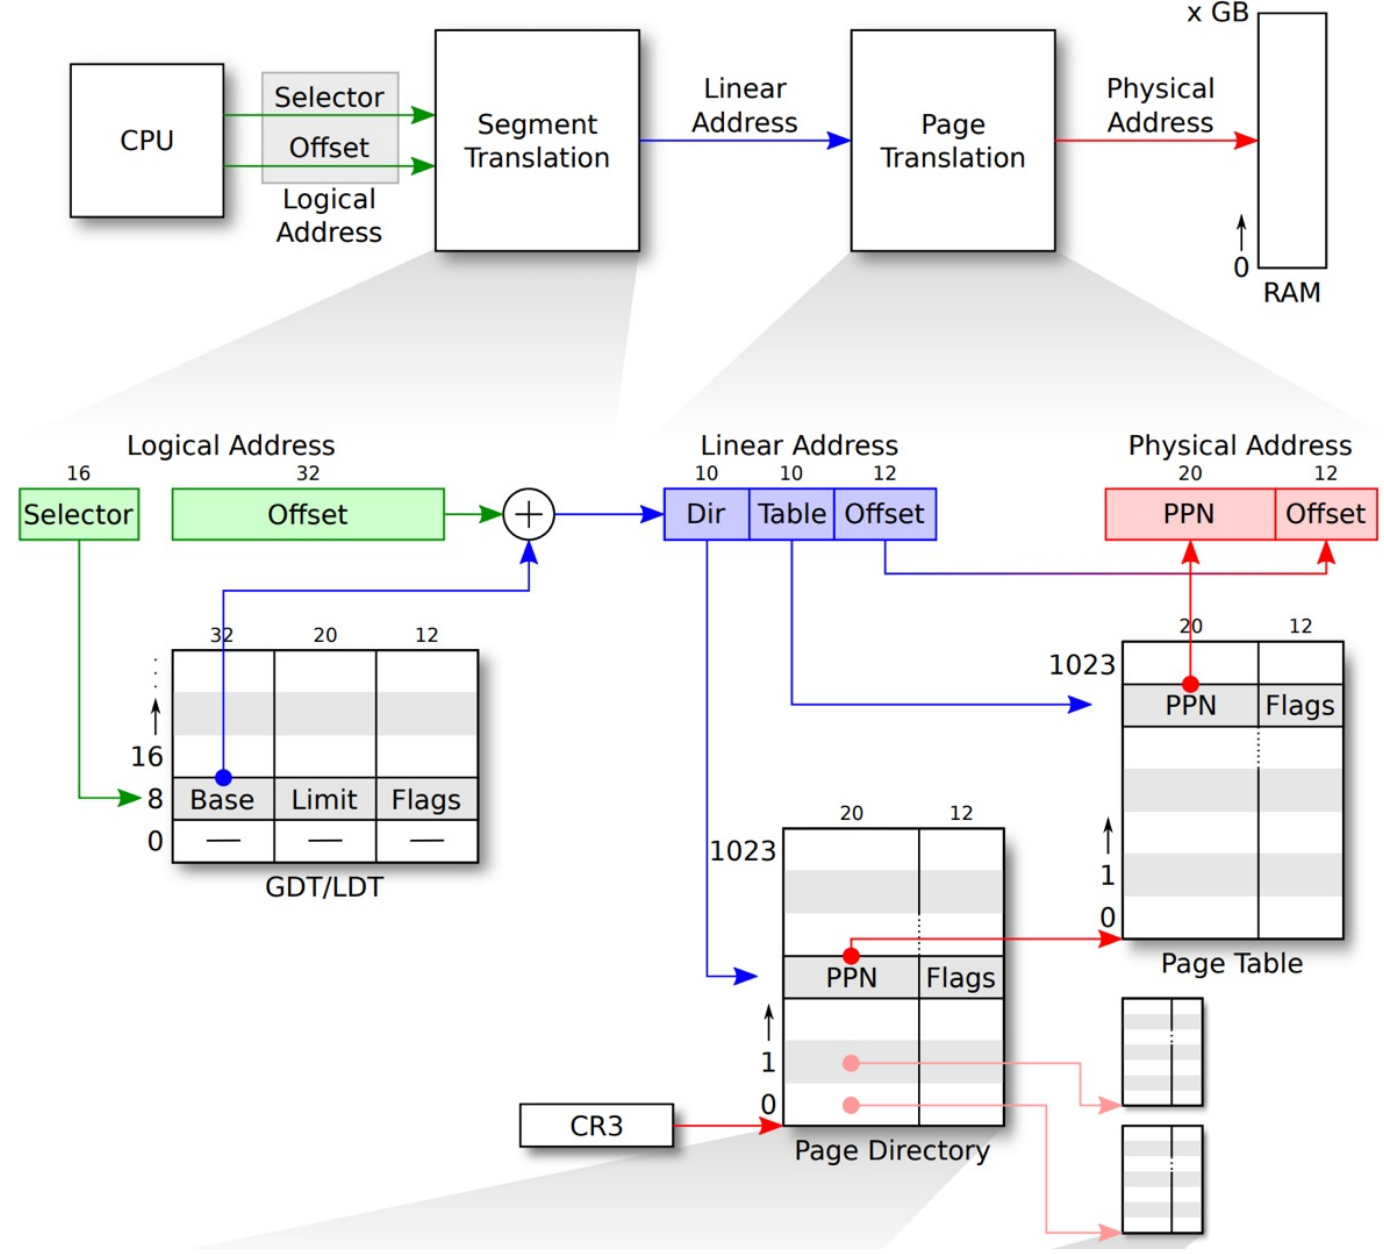

Paging: Virtual Memory

Protection: isolate program's execution environment
Prevent overflow/overwriting between multiple programs?

x86 Memory Access

Protected-Mode Address Translation
