

Securing Self-Driving Cars (one company at a time)

Dr. Charlie Miller, Chris Valasek

Colton Asnes

TABLE OF CONTENTS

01

Self-Driving Cars

Current State and Examples

03

Defense Mechanisms

Variety of current built-in defenses and recommended defenses

02

Threat Model

Must understand what threats AVs are vulnerable to

04

Analysis of Paper

Acceptance/Rejection
Style of paper

Goal of the paper

Establish fundamental details of autonomous cars, their threat level, and security mechanisms for members of the *public* and other fields

Self-Driving Cars

Current State

01

Self-Driving Car Levels

Level 0: No automation: driver in full control; even with cruise control

Level 1: Driver assistance: ex. lane keep assistance

Level 2: Partial automation: car controls steering, acceleration, and braking; driver must keep hands on the wheel

Level 3: Conditional automation: car *can* control all elements of driving and monitors environment

Level 4: High automation: can operate without a human; ex. Self-driving fleets from uber, cruise

Level 5: Full automation: needs no human interaction at all

USE CASES

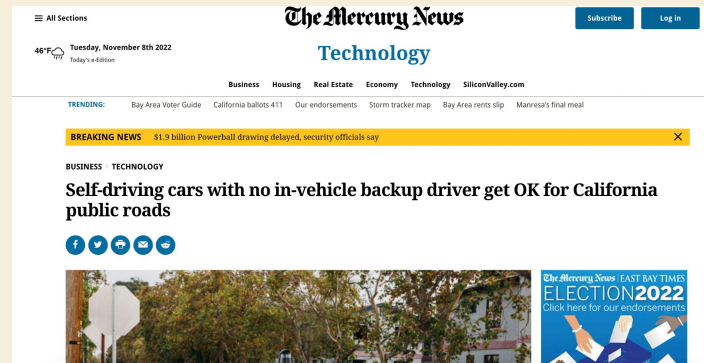

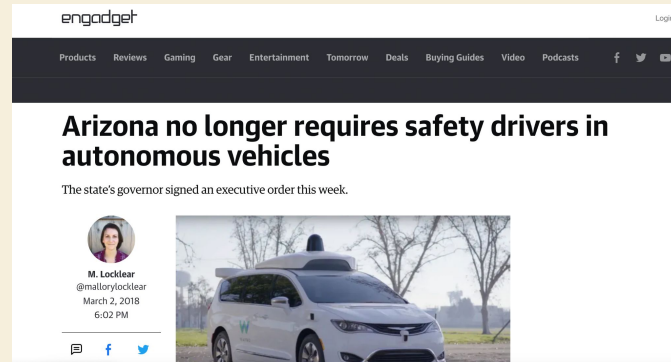

Production
Vehicles

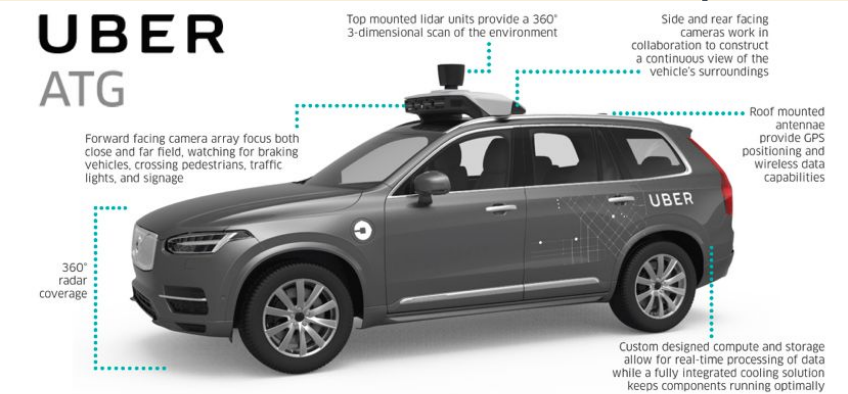

Ride-Sharing

Regulations

- Many places have no regulations on self-driving cars
- 2014: California required human inside self-driving cars
- Arizona (2018): no longer required safety drivers
- California followed; required ways for the vehicle to communicate with law enforcement
- Self-driving programs drive a *lot*

Level 4 AV Hardware

Self Driving Uber sensor suite

- 7 Cameras
- 1 Laser
- Inertial Measurement Units

Custom compute and data storage
360° radar coverage

Advanced Technologies Group

UBER

Lidar is incredibly expensive and *not* available yet on production level vehicles

Significant computational power needed to process sensor input and actuate decisions

currently available passenger vehicle.

Terrible diagram of AV stack and base vehicle communications

Level 4 AV Hardware

Using Tablets that allow passengers to interact with the vehicle

- Allow passenger to indicate a stop or destination change
- Secure module not connected to CAN

ATTACKS

**2011 CHEVY
MALIBU**

Vulnerability in
Bluetooth
stack

CID old web
browser

**2016 Tesla
Model S**

**2015 Jeep
Cherokee**

Vulnerability
from Internet
connection

Rogue cellular
base stations

2018 BMW i3

Challenges in Securing Self-Driving Cars

01

Speed

Each company wants the biggest fleet

02

Base Vehicle

Need to secure the AV system and base vehicle

03

Ethernet

Non-standard TCP stacks

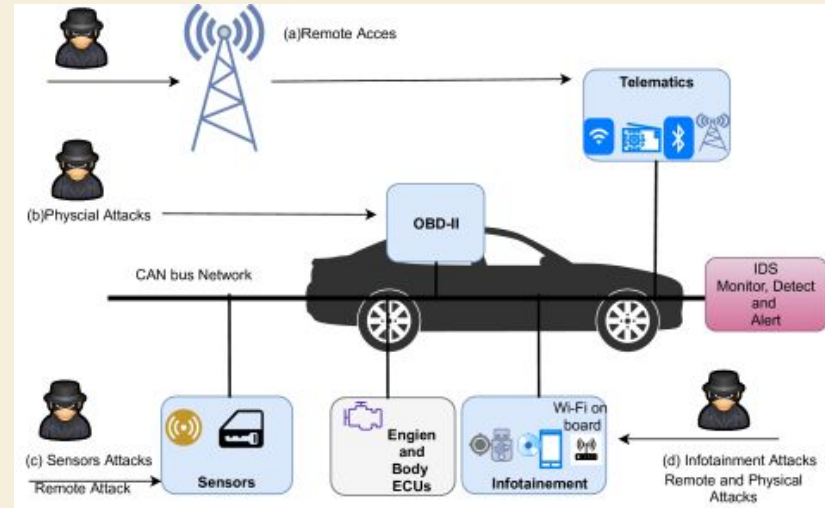

Threat Model

Long Distance (Remote Attacks):

- Can affect multiple vehicles at once
 - Listening service in the communications module
 - Remote assistance style feature (Phantom Auto)
 - Attack on base vehicle: telematics, infotainment, etc.
 -

Short Distance (Remote Attacks)

- Low-scale
 - Attack against Wi-Fi module
 - Attack against Bluetooth
 - Attack against TPMS
 - Jamming sensors

Threat Model

Physical Access Attacks:

Direct injection of CAN messages onto the CAN bus

- Implanting a device of OBD-ii dongle
- Reprogramming an ECU
- Access to CAN via Ethernet

Car hackers use laptop to control standard car

© 26 July 2013

The researchers managed to stop, start and steer a car with an old Nintendo handset

Defensive Goals

Can *never* be attack proof

Primary concern is preventing passenger injury

Focus on long-distance remote attacks that are large-scale

Defenses

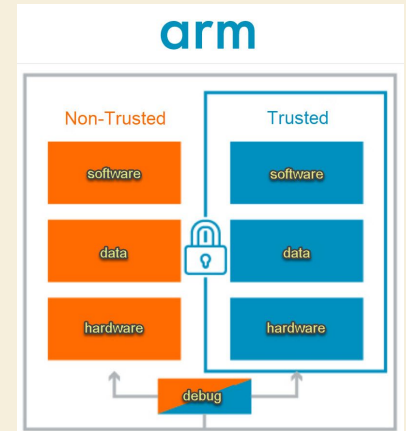

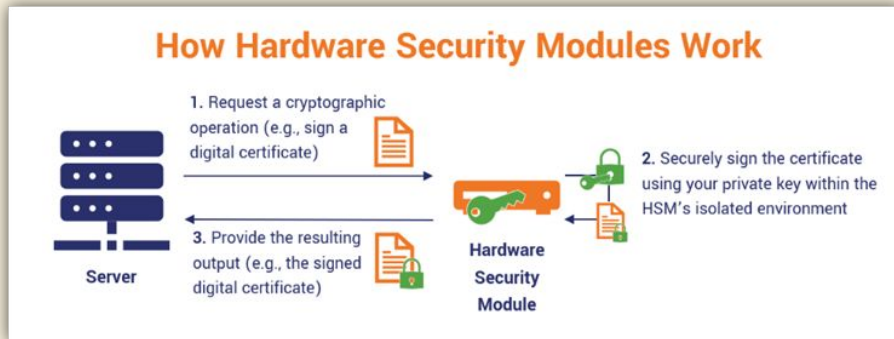

Trusted Execution and Bootstrapping

- Verify during boot up that AV code comes from manufacturer
- “Secure Boot” verifies code through trusted key in a write-protection portion of computer
- BIOS/firmware verifies bootloader -> verifies the kernel -> verifies the software image
- Private key soldered into motherboard
 - Force user to enter username/password to verify key from network service
 - Request VIN or other identifying components from motherboard

Private Key Storage

Trusted Execution and Bootstrapping

- Keys stored in Trusted Platform Module (TMP) or stored via HSM or ARM TrustZone
 - Applies for software updates as well

Attack Surface Reduction

Removing Inbound Internet Connections

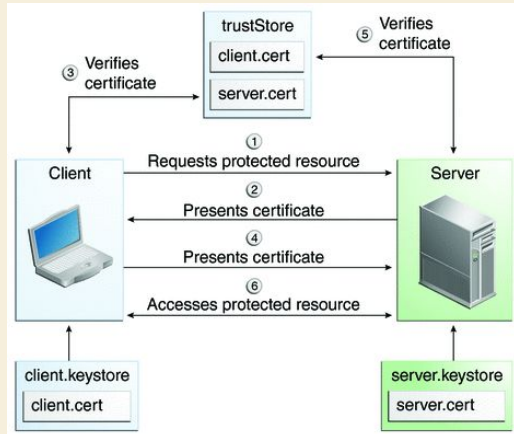

Removing Bluetooth Capability

Encryption of Data

Separation from CAN Bus

Attack Surface Reduction

Message Signing

Controlling Remote Access

Threat Detection

Acceptance/Rejection

Accepted, although unprofessional process and lacked detail

Questions & Discussion

Defense

This paper focused on defending level 4 autonomous vehicles. Most consumer autonomous vehicles are level 2 or 3 and would have entertainment components. How could we defend against attacks?

Ride Share

Would you feel safe using level 4 autonomous ride sharing? What safety features would you be comfortable with?
